Learning with Generative AI – An Overview

At TP, we encourage the effective and ethical use of AI generative tools such as ChatGPT for teaching and learning. This playbook serves as a guide to support students to leverage AI generative tools in their learning journey.

What is ChatGPT

ChatGPT is a conversational artificial intelligence model developed by OpenAI. Its purpose is to generate human-like text responses to prompts given to it.

Leveraging ChatGPT For Learning

Helpful in

- Explaining complex topics
- Supporting research and queries
- Providing suggestions to improve writing
- Generating ideas
- Assisting with time management and goal setting

Beware

- Considered as plagiarism if you copy answers produced in totality!
- Dangers of sharing personal or confidential information
- Unverified data. Do not rely solely on information produced by the AI tool – verify and fact check!

What is ChatGPT?

ChatGPT is a conversational artificial intelligence model developed by OpenAI. Its purpose is to generate human-like text responses to prompts given to it.

ChatGPT was created to help people communicate more effectively with computers. For example, if you have a question or need help with something, you can chat with ChatGPT to get started.

One thing to remember is that ChatGPT is not a real person and does not have feelings or emotions as we do. So it's crucial to treat ChatGPT respectfully and not ask it to do anything inappropriate or harmful.

Generated by DALL-E: A robot sitting in the corner of a room.

What Can I Do With ChatGPT?

ChatGPT is designed to simulate conversations with people. Therefore, it works best with natural language. You can phrase your questions in a conversational tone, providing as much context as possible, and ChatGPT will answer your queries.

ChatGPT can generate text in various formats, such as summaries, essays, and news articles, based on given prompts or topics.

There are many ways you can leverage ChatGPT to support your learning. It can help to explain complex topics, search and provide information from various sources, assist with idea generation to support your writing and many more.

What Can I NOT Do With ChatGPT?

It is important to use ChatGPT as a tool to supplement your learning and not rely on it too heavily. Always fact-check and use multiple sources to verify information.

Do not copy answers produced in totality as that is considered as plagiarism.

Do not release personal or confidential information.

What Can I NOT Do With ChatGPT?

Think (A R C)3 – Ethical Use Of ChatGPT

A

Academic Integrity: Uphold integrity and avoid cheating, plagiarism, and deception.

Awareness of Bias: Be aware of potential biases by critically evaluating the content provided.

Accuracy and Reliability: Critically evaluate the information provided and verify it through reputable sources for accuracy.

R

Responsible Use: Use responsibly and avoid unethical behaviour.

Respect for Others: Respect the rights and privacy of others and avoid engaging in cyberbullying, harassment, or violating any laws or regulations.

Responsible Data Handling: Be mindful of the data you input and avoid sharing personal or sensitive information.

C

Communication : Be transparent on your use of ChatGPT by giving proper attribution and acknowledging the contribution of the model.

Creative and Original: Strive to develop original thoughts and ideas even when using ChatGPT.

Critical Thinking: Use ChatGPT as a tool to enhance your critical thinking skills.

Ask Effective Questions

Learn how to get the most out of ChatGPT by asking the right questions.

Be specific and clear

- Use precise language and avoid ambiguity or vagueness.
- Use short sentences and avoid complex phrasing or jargon.

Instead of:

“We need to implement a DevOps approach to software development to achieve continuous delivery and deployment.”

 Implementing a DevOps approach to software development can help achieve continuous delivery and deployment by improving collaboration and communication between development and operations teams, increasing automation, and focusing on delivering value to the end-users. Here are some steps that can help you implement a DevOps approach:

1. Define your goals: Start by identifying the specific goals you want to achieve through DevOps, such as faster delivery, better quality, or more efficient processes.

Rephrase as:

“Can you explain what a DevOps approach is in software development, and how it can help achieve continuous delivery and deployment?”

 Certainly! A DevOps approach is a set of practices and principles that aim to improve collaboration and communication between software development and IT operations teams, with the goal of delivering software faster, more reliably, and with higher quality.

Traditionally, development and operations teams have worked in silos, with little communication or collaboration between them. This can lead to inefficiencies, delays, and mistakes in the software development process. DevOps aims to break down these silos and create a more integrated, collaborative approach to software development and delivery.

Ask Effective Questions

Avoid Leading or Biased Questions

Try to phrase your questions in a neutral and objective way to avoid biasing the response.

Instead of:

“How great is my creative writing short story? "Snow covered my yard. It had come from the north, driven by the night's ***.”

As an AI language model, I cannot give a definitive or objective assessment of how great your creative writing short story is. However, I can provide some feedback based on common elements of good writing.

Your short story has a clear setting and atmosphere that sets the mood for the story. You use descriptive language effectively to create vivid imagery, which helps the reader to visualize the scene. Your use of sensory details like the smell of the sea and the warmth of the sun add depth and texture to the story.

Rephrase as:

“Can you give me some feedback on my creative writing short story? "Snow covered my yard. It had come from the north, driven by the night's ***.”

Great job on your creative writing short story! You have created a clear and vivid image of the snow-covered yard and the emotions that the narrator is feeling. The use of sensory details, such as the smell of the sea and the warmth of the sun, helps to bring the scene to life and immerse the reader in the story.

The transition from the idyllic scene to the news of Amy leaving is done smoothly and effectively. The dialogue between the two friends feels natural, and the way you show Belinda's emotions is powerful. The use of the mug with the words "Best Friends" as a symbol of their friendship is a nice touch, and it brings a sense of warmth and comfort to the story.

Ask Effective Questions

Ask Follow-up Questions To Diversify

Broaden your questions to get more diverse answers.

For example, after putting the below text:

Prompt: “Explain this code to me. What does it do? Explain in detail. `const Animation = require('Animation'); const Blocks = ***`”

This is a class in JavaScript called ``JumpGame`` that is used to create a game where a player character jumps over obstacles. The class has several methods that handle different aspects of the game such as setting up the player character, setting up the obstacles, and making the player character jump and fall.

At the beginning of the class, there are several lines that import various modules that provide functions and objects that are used throughout the class. The ``Animation`` module allows for the

Use follow up question:

Prompt: “Explain the jump function and why `async``?”

The ``jump`` method is an asynchronous function that is called when the player character should jump. It applies an animation that moves the player character upward and then calls the ``fall`` method to make the player character fall back down.

The ``jump`` method is asynchronous because it uses the ``Animation`` module to create and apply an animation to the player character. Creating and applying an animation is an asynchronous operation because it involves waiting for the animation to be created and applied.

Ask Effective Questions

Ask Follow-up Questions To Deepen Understanding

Refine your questions to get more specific and relevant answers.

For example, after putting the below text:

Prompt: “I want to write a reflection report on my trip to the heritage centre. Can you provide me with some standard guidelines on writing a reflection report?”

Certainly! Here are some standard guidelines for writing a reflection report:

1. Introduction: Start with a brief introduction that provides some context for your reflection. You may want to include information about the place you visited, the purpose of your visit, and your expectations before the visit.
2. Description: Describe your experience in detail. Include information about what you saw, heard, smelled, tasted, and touched. Also, describe the people you met, the conversations you had, and the emotions you felt during the visit.

Use follow up question:

Prompt: “Can you provide me with a sample of reflective report in about 150 words”?

Sure! Here's an example reflective report on a visit to a heritage center:

During my visit to the heritage center, I was struck by the rich history and culture of the community. As I walked through the exhibits, I saw artifacts and heard stories that brought the past to life. I felt a sense of awe and respect for the people who had lived in this area for generations and the challenges they had faced.

Types of Prompts

There are many types of prompts you can use ChatGPT for, here are some examples.

UNDERSTANDING

Use simple questions to generate explanations

GUIDANCE

Provide guidance and tips on completing a task

FOLLOW UP QUESTIONS

Build on previous answer by asking related question

FEEDBACK ON WORK

Provide feedback on quality of a piece of written work

ENHANCING KNOWLEDGE

Generate explanations on topics that students already have basic skills

SUMMARISE

Highlight key points and aid study

IDEA GENERATION

Use simple questions to generate a variety of information.

AI ART

Generate AI art and icons

AI Art

Generate prompts for AI art like DALL-E

To create an effective prompt for AI art, it's essential to have a clear idea of the desired art style and what the subject matter should be. It can help you arrange images, materials, text, and design elements to represent the final design's style.

Step 1:

Main Prompt: "Write me 3 DALL-E prompts for a warzone inspired cafe, futuristic, in a modern city."

1. Futuristic cafe in modern city with warzone theme. Industrial design, bullet holes, military gear furniture, and military-themed menu.
2. Cafe in war-torn city repurposed into trendy spot. Mix of modern/rustic design, artistic murals, and fusion cuisine inspired by region.
3. High-tech cafe designed like military bunker. Minimalist design, reinforced concrete, military insignia projections, high-tech menu, and virtual reality warzone experience.

Step 2:

Go to DALL-E at <https://labs.openai.com/>
Copy and paste the chosen prompt

DALL-E ▾

Start with a detailed description

High-tech cafe designed like military bunker. minimalist design, reinforced concrete, military insignia projections, high-tech menu, and virtual reality war experience.

Generate

Simplify Difficult Concepts

ChatGPT can help you to deconstruct difficult concepts learnt into smaller, bitesize fractions that are easier to comprehend. You can also leverage on ChatGPT to acquire step by step instructions to perform a task.

Prompt: “Can you show me how to apply the McCabe Thiele's method?”

Sure, I can explain how to apply the McCabe-Thiele method, which is a graphical method used to analyze distillation processes.

The McCabe-Thiele method is used to determine the number of theoretical plates required for a given separation in a distillation column, and it relies on the concept of equilibrium stages.

To apply the McCabe-Thiele method, you need to follow these steps:

1. Draw the equilibrium curve: The first step is to plot the equilibrium curve, which represents the relationship between the mole fraction of the more volatile component in the vapor phase (y-axis) and the mole fraction of the same component in the liquid phase (x-axis). This curve can be obtained from experimental data or calculated using thermodynamic models.

Prompt: “Can you tell me how waste cooking oil can be converted into biodiesel?”

Yes, I can explain the basic process of how waste cooking oil can be converted into biodiesel:

1. Collection: The first step is to collect the waste cooking oil from restaurants, homes, and other sources.
2. Filtering: The collected oil is then filtered to remove any solid impurities or food particles.
3. Pre-treatment: The filtered oil is heated to remove any water content, which can interfere with the conversion process.
4. Transesterification: The pre-treated oil is mixed with an alcohol (usually methanol) and a catalyst (usually sodium hydroxide) to undergo a chemical reaction called transesterification. This process converts the oil into biodiesel and glycerol.

Circuit Design

As an engineering student, you may leverage ChatGPT to generate circuit related questions. ChatGPT has the ability to display simple circuits or share images through links.

Prompt: “Can you suggest one design of a low power amplifier using op-amp 741?”

Sure, here is a simple design of a low power amplifier using an op-amp 741:

1. Connect the non-inverting input of the op-amp to the signal source.
2. Connect a feedback resistor (R_f) from the output of the op-amp to the inverting input.
3. Connect an input resistor (R_{in}) from the inverting input of the op-amp to ground.
4. Connect a bypass capacitor (C_b) in parallel with the input resistor to reduce noise.
5. Connect a decoupling capacitor (C_d) in parallel with the power supply pins of the op-amp to reduce noise.
6. Choose appropriate resistor values based on the desired gain and input impedance.

Here is the schematic diagram:

lua

Copy code

```
+-----+
|               |
Vin -----| Non-inverting|----- Vout
|           Input       |
|               |
+-----+
```

Note: Links provided may not be active anymore. In such cases, you may try alternative approaches to get your answer.

Follow-up Prompt: “Explain how the circuit works.”

Sure, here is an explanation of how the circuit works:

The op-amp 741 is a voltage amplifier that amplifies the difference between its two input terminals. In this circuit, the non-inverting input of the op-amp is connected to the signal source, while the inverting input is connected to a feedback resistor (R_f). The output of the op-amp is also connected to the feedback resistor.

Remember to ask follow up prompts to deepen your understanding on the circuit design!

Coding & Programming

ChatGPT can be of great help to a programmer. It can generate a code and provide an explanation of a code. It can also point out issues with your code and help debug. But do not assume that it will detect all errors, or even correctly identify errors in every case. Critical evaluation is still necessary.

Draft VBA Codes

If you have a project in mind to use VBA to code, ChatGPT can generate a drafted code, which serves as a reference to start.

Prompt: “Can you write a VBA code to extract data from one excel to another excel?”

Yes, I can help you with that! Here's an example VBA code that extracts data from one Excel workbook and copies it to another:

vbnet

Copy code

```
Sub ExtractData()  
  
    Dim wbSource As Workbook  
    Dim wbTarget As Workbook  
    Dim wsSource As Worksheet  
    Dim wsTarget As Worksheet
```

Follow-up Prompt: “Can you explain this code to me?”

This VBA code is a concentration calculator, which prompts the user to enter values for the mass of various chemical reagents used and the final volume of the solution, and then calculates the concentration of each reagent in the solution. Here is a line-by-line explanation of the code:

SCSS

Copy code

```
a = InputBox("What is the Mass NaOH used,g?")  
b = InputBox("what is the final Volume of the solution,ml?")  
  
NaOH = Cells(2, 10)
```

Coding & Programming

■ Debug and Refactor Codes

Not sure if there's something wrong with your code? Got an exception? ChatGPT can point out the issues with your code!

Prompt: "My program is not working. What are the errors?" <insert codes>

My program is not working. What are the errors?
`months = ['January', 'February', 'March', 'April', 'May', 'June', 'July', 'August', 'September', 'October', 'November', 'December']`

```
veh_data = {}
```

```
for i,x in month:
```

```
    v1 = float(input(f"Enter rainfall for {x1}: "))
```

```
    veh_data[i] = v
```

There are several errors in the code you provided:

1. The variable `month` should be replaced with `months` in the `for` loop to correctly iterate over the list of month names.
2. In the `input()` function, `x1` should be replaced with `x` to correctly prompt the user to enter rainfall for the current month.
3. In the assignment statement `veh_data[i] = v`, `v` should be replaced with `v1` to correctly store the rainfall value for the current month.

Here's the corrected code:

python

Copy code

```
months = ['January', 'February', 'March', 'April', 'May', 'June', 'July', 'August',
```

```
veh_data = {}
```

Coding & Programming

■ Programming

You can pick up specific programming techniques by getting ChatGPT to suggest codes, clearly specifying your requirement in the prompt.

Prompt: “Given a population list, write me a Python program to find the mean, median, highest and lowest age of a population. Explain the codes step-by-step.”

Sure, I'd be happy to help! Here's a Python program that will find the mean, median, highest, and lowest age of a population:

```
python Copy code

# population list
population = [25, 35, 20, 40, 30, 45, 55, 65, 70, 80]

# Mean Calculation
mean_age = sum(population) / len(population)
print("Mean age:", mean_age)

# Median Calculation
sorted_population = sorted(population)
n = len(sorted_population)
if n % 2 == 0:
    median_age = (sorted_population[int(n/2)-1] + sorted_population[int(n/2)]) / 2
else:
```

Let's break down the program step-by-step:

1. First, we define the population list. In this case, we have ten ages from 25 to 80.
2. Next, we calculate the mean age of the population by using the `sum()` function to add up all the ages in the list, and then dividing by the length of the list using the `len()` function. We store this value in a variable called `mean_age`.
3. We then print out the mean age using the `print()` function.

This program should output the following:

```
yaml

Mean age: 45.0
Median age: 42.5
Max age: 80
Min age: 20
```

Coding & Programming

Coding With Constraints

You can input follow-up prompts to generate further information on the codes generated.

Follow-up Prompt: “How do I use functions in the above program while yet giving me the same results? “

Sure, you can use functions to compute the mean, median, highest, and lowest age of a population. Here's an updated Python program that uses functions:

python

Copy code

```
def compute_mean(population):  
    return sum(population) / len(population)  
  
def compute_median(population):  
    population.sort()  
    n = len(population)  
    if n % 2 == 0:  
        median = (population[n//2-1] + population[n//2]) / 2  
    else:  
        median = population[n//2]  
    return median
```

Let me explain the changes step-by-step:

1. We define four functions: `compute\_mean`, `compute\_median`, `find\_highest\_age`, and `find\_lowest\_age`. These functions take the population list as input and compute the mean, median, highest, and lowest age respectively. The functions return the computed values.
2. We remove the code for computing the mean, median, highest, and lowest age from the main program, and replace them with function calls to `compute\_mean`, `compute\_median`, `find\_highest\_age`, and `find\_lowest\_age`.

Coding & Programming

Understanding Codes

You can paste a code and ChatGPT will generate a response with its interpretation and explanation of the code.

Prompt: “Can you explain this code to me?” <insert code>

```
namespace Patterns
{
    template <typename T>
    class FiniteStateMachine;

    template <typename T>
    class State
    {
    public:
        // The ID of the state.
        inline T getID()
        {
            return mID;
        }

        inline const std::string& getName()
        {
            return mName;
        }
    }
```

This is a C++ code implementing a Finite State Machine (FSM) design pattern. An FSM is a mathematical model that can be used to describe and control the behavior of complex systems. It consists of a set of states and transitions between these states.

The code defines two main classes: `State` and `FiniteStateMachine`. The `State` class represents a single state in the FSM, while the `FiniteStateMachine` class represents the entire FSM.

The `State` class is a template class that takes a type parameter `T`. It has a constructor that takes a reference to a `FiniteStateMachine` object, an ID and an optional name for the state. It also has three virtual functions: `enter()`, `exit()`, and `update()`. These functions can be overridden by derived classes to provide custom behavior when a state is entered, exited, or updated.

Follow-up Prompt: “Explain `std::map<T, std::unique_ptr<State<T>>> mStates;`”

`std::map` is a standard library container that stores key-value pairs. In this code, `mStates` is a `std::map` that stores key-value pairs, where the key is of type `T` and the value is a `std::unique_ptr` to a `State<T>` object.

`std::unique_ptr` is a smart pointer that manages a dynamically allocated object and automatically deletes it when it goes out of scope. Using `std::unique_ptr` ensures that each state object is only owned by one `std::unique_ptr` and that it is automatically deleted when the map goes out of scope.

Interpretation of Data

ChatGPT can help you with interpreting data in a table form and provide basic insights from the dataset.

Prompt: “Write APA results of the input provided below.”

write APA results of the inputs provided below:

Earpiece Two-Way Randomized ANOVA Omnibus Tests

Factor	Sum Squares	df of	F	p	η^2
Model	448579	5	44.2	<.001	.559
Priming	71390	1	35.1	<.001	.168
Anchor	256374	2	63.1	<.001	.320
Priming * Anchor	120815	2	29.7	<.001	.151
Residuals	353476	174			
Total	802055	179			

Follow-up Prompt: “Can you explain this code to me?”

Results

A two-way randomized ANOVA omnibus test was conducted to examine the effects of priming and anchor on earpiece performance. The analysis revealed a significant main effect of model, $F(5, 174) = 44.2, p < .001, \eta^2 = .559$. Additionally, there was a significant main effect of priming, $F(1, 174) = 35.1, p < .001, \eta^2 = .168$, and a significant main effect of anchor, $F(2, 174) = 63.1, p < .001, \eta^2 = .320$. There was also a significant interaction effect between priming and anchor, $F(2, 174) = 29.7, p < .001, \eta^2 = .151$. These results indicate that both priming and anchor have significant effects on earpiece performance, and that the relationship between the two factors is complex.

Idea Generation

If you are struggling with a particular assignment or need help with a specific subject, you can ask ChatGPT for assistance. ChatGPT can help you with research, explain difficult concepts, or even provide examples to help you understand a topic better.

Prompt: “Can you give me two ideas about using CRISPR to produce a genetically-modified animal that displays a novel trait of economic importance..”

Sure! Here are two ideas:

1. Disease-resistant livestock: One potential application of CRISPR in animal agriculture is to produce livestock that are resistant to diseases. For example, you could use CRISPR to modify the genes of pigs to make them resistant to African swine fever, a highly contagious and deadly viral disease that has devastated pig populations in many countries. By producing disease-resistant pigs, farmers could reduce the risk of disease outbreaks, improve animal welfare, and increase their profits by avoiding losses due to sick or dead animals.

Follow-up Prompt: “Give me one example of disease in livestock where there is no solution yet and cause huge losses in livestock.”

One example of a disease in livestock where there is no complete solution yet and causes huge losses is the Foot-and-Mouth Disease (FMD). FMD is a highly contagious viral disease that affects cloven-hoofed animals such as cattle, pigs, sheep, and goats. It causes fever, blister-like sores on the tongue and lips, in and around the mouth, on the teats, and between the hooves, leading to lameness and reduced milk and meat production.

FMD outbreaks result in huge economic losses in the livestock industry due to reduced productivity, animal deaths, trade restrictions, and costs associated with disease control

Self-directed Learning & Deepen Understanding

Research into specific subject matter may sometimes require broad, initial understanding before deeper and lateral investigation could be conducted through other means. ChatGPT can help to quickly provide a general understanding. Follow-up prompts can be used to provide further reading materials to look into the subject matter more deeply.

Prompt: “What does the phoenix represent in Chinese Peranakan culture?”

The phoenix, or fenghuang (鳳凰) in Chinese Peranakan culture, is a symbol of beauty, grace, and prosperity. It is often depicted as a bird with colorful feathers and a long flowing tail, and is believed to be a manifestation of the yin (feminine) energy.

In Chinese Peranakan culture, the phoenix is often paired with the dragon, which represents the yang (masculine) energy. Together, they symbolize the balance between yin and yang, and are often used to represent the harmony between a married couple.

Follow-up Prompt: “Can you provide me book resources that I can look into the deepen my understanding on the symbolism of the phoenix?”

Certainly! Here are some book resources that can help deepen your understanding of the symbolism of the phoenix:

1. "The Phoenix: An Unnatural Biography of a Mythical Beast" by Joseph Nigg - This book explores the history and mythology of the phoenix, tracing its origins from ancient Egypt to modern popular culture. It delves into the many different meanings and interpretations of the phoenix across various cultures and time periods.

Itinerary & Activity Planning

Every student would have the opportunity to plan for a school event, activity or even an overseas trip. Students from Diploma in Hospitality & Tourism Management can also leverage ChatGPT to perform basic research + analysis + writing out schedules for assignment which can be helpful during the exploratory phase.

■ Research

You can leverage on ChatGPT to conduct exploratory research on suitable places of interest that best fits your activity or trip.

Prompt: “Could you share more heritage information and sites with middle eastern influences in Singapore?”

Sure! Singapore has a long and interesting history of interactions with the Middle East, dating back to the 9th century. Here are some heritage sites and information that showcase this history:

1. Arab Street and Kampong Glam - This historic neighborhood is named after the Malay word "kampung" (village) and "Gelam," which is the name of the fragrant paperbark tree that once grew abundantly in the area. Arab Street is home to numerous shops selling textiles, carpets, and perfumes, and is also where you'll find the iconic Sultan Mosque. This area has a strong Arab and Muslim influence, with many Middle Eastern restaurants and shops selling goods from the region.
2. Hajjah Fatimah Mosque - Located in the town of Kampong Glam, this mosque was built in 1846 by a wealthy Muslim woman named Hajjah Fatimah. The mosque features a

Itinerary & Activity Planning

Itinerary Planning

Chat GPT can provide a draft itinerary based on your requirements catering to different budget. It can even provide details such as opening hours.

Prompt: “Please draft a two-day itinerary to visit middle eastern heritage sites and places of interest in Singapore.”

Sure, here's a suggested two-day itinerary to visit Middle Eastern heritage sites and places of interest in Singapore:

Day 1:

Morning:

- Start your day at Arab Street in Kampong Glam. Explore the colorful shophouses and browse the various shops selling textiles, carpets, and perfumes.
- Visit the iconic Sultan Mosque, one of the most recognizable landmarks in Singapore.

Follow-up Prompt: “How much do some of these places of interest cost?”

The cost of admission to the various heritage sites and places of interest in Singapore can vary. Here are some estimated costs for some of the sites mentioned in the itinerary:

- Sultan Mosque: Admission to the mosque is free, but guided tours are available for a fee of around SGD 5 per person.

Follow-up Prompt: “Could you share the reference links?”

I apologize for not providing the reference links earlier. Here are the links to the official websites for the attractions mentioned in my previous response:

- Sultan Mosque: <https://www.sultanmosque.org.sg/visit-us/>
- Malay Heritage Centre: <https://www.malayheritage.gov.sg/en>

Note: You may ask for the reference links to verify the rates provided too!

Improve Writing

Conducting research and writing essays are part of every student's learning journey. ChatGPT can help generate background information and facts to get you started on your writing. It could also provide useful examples that may help support your ideas.

■ Provide Examples

You can leverage on ChatGPT to provide examples and use cases to a topic you are writing.

Prompt: "Could you share a use case of recycling or upcycling in Singapore?"

Certainly! One example of upcycling in Singapore is the "Upcycling Challenge" organized by the National Environment Agency (NEA). The challenge invites individuals and groups to transform discarded materials into new and useful products, and promotes the concept of waste reduction through creative reuse.

In one edition of the challenge, participants were asked to upcycle discarded wood pallets into functional and creative items. The entries ranged from furniture such as benches and tables, to decorative items such as planters and photo frames. Some participants even used the wood to create artworks and sculptures.

Follow-up Prompt: "Could you also relate a similar program that are meant for students?"

Yes, there are several programs in Singapore that are specifically targeted at students to promote recycling and upcycling.

One such program is the "3R (Reduce, Reuse, Recycle) Program" by the National Environment Agency (NEA). The program aims to educate students on the importance of waste reduction and encourage them to adopt sustainable practices. Through a series of interactive workshops and educational materials, students learn about the 3Rs and how they can incorporate these principles into their daily lives.

Generate Interview Questions

Asking the right questions to support your assignment is important. With the right information, ChatGPT can generate useful interview questions to help you get started. While questions can be generated, interviews need to be conducted by a human being. These conversations are live and students must demonstrate their ability to ask probing questions based on what the interviewees are saying.

■ Question generation

Prompt: “If I were to interview a student on matters relating to recycling or upcycling, could you provide a few example of interview questions?”

Certainly! Here are some example interview questions that you could use when interviewing a student about recycling or upcycling:

1. What does recycling/upcycling mean to you, and why do you think it's important?
2. How have you incorporated recycling/upcycling into your daily life, and what challenges have you faced in doing so?
3. What initiatives or programs have you participated in that promote recycling/upcycling, and how have they impacted your understanding of these concepts?
4. What creative ideas do you have for upcycling common household items, and how would you go about implementing these ideas?
5. How do you think we can encourage more people to recycle/upcycle, and what role can schools play in promoting these practices?
6. How do you see recycling/upcycling fitting into broader environmental sustainability goals, and why is it important to consider the environmental impact of our actions?
7. What do you think are some of the challenges facing Singapore when it comes to recycling/upcycling, and how can we overcome these challenges?

These questions should help to elicit thoughtful responses and insights from the student about their perspectives on recycling and upcycling.

Understanding Math Concepts

ChatGPT can help to explain difficult concepts, or even provide examples to help you understand a topic/concept better. It can help you understand the relevance of learning math by giving examples on real-life applications.

Prompt: “Please explain differentiation and integration in a simple way such that a 10 year old kid can understand. Please use a real-life example in your explanation.”

Sure, I can explain differentiation and integration to a 10 year old using a real-life example.

Let's start with differentiation. Do you know what speed is? When you ride your bike, you might speed up or slow down depending on how fast you pedal, right? Now, let's say we want to know how fast you are going at a certain moment, like when you ride past a speedometer. The speedometer tells you how fast you are going, but how does it know?

This is where differentiation comes in. We can use a mathematical function to describe how your speed changes over time. We call this function the derivative, and it tells us how much your speed is changing at each moment in time. So, when you ride past the speedometer, it can use the derivative to figure out how fast you are going at that exact moment.

Follow-up Prompt: “Please give some real-life examples on the application of differential equations in the field of medical biotechnology.”

Differential equations have numerous applications in medical biotechnology. Here are some real-life examples:

1. Pharmacokinetics: Differential equations are used to model the concentration of drugs in the bloodstream over time. This information is critical for determining the proper dosage of a drug to be administered to a patient.
2. Cardiology: Differential equations are used to model the electrical activity of the heart, which is important in diagnosing and treating heart conditions.

Build Applications & Prototypes

ChatGPT can help to explain and provide step-by-set instructions on 'how-to' go about carrying out an experiment, building a prototype or an application!

Prompt: "How do I build an application to help me manage my timetable using power apps?"

Sure! Here are general steps to build a simple timetable management application using Microsoft Power Apps:

1. Sign Up for Power Apps: If you haven't already, sign up for Microsoft Power Apps at <https://powerapps.microsoft.com/>. You may need to choose a subscription plan depending on your requirements.
2. Create a New App: Once you are logged in to Power Apps, click on "Create" in the left-hand menu and select "Canvas app" to create a new app from scratch.
3. Choose a Layout: Choose a layout for your app, such as tablet or phone, and select a blank template or a pre-designed template that fits your needs.

Prompt: "Show me how I can build a simple aircraft prototype to demonstrate Bernoulli's principle?"

Building an aircraft is a complex process that requires knowledge of aerodynamics, mechanics, and materials engineering. However, I can provide you with some general steps you can take to create a simple model aircraft that demonstrates Bernoulli's principle in action. Here's how:

Materials you will need:

- Foam board or balsa wood
- Hobby knife or scissors
- Ruler
- Pencil
- Glue
- Motor and propeller (optional)

Prompt: "."
